# Ustek RFID - PHP Homework

We would like to see what you can do by giving you a small assignment. It should take a few hours to finish this assignment, but any extra polish or features you might want to put in will be appreciated.

## The assignment

We would like you to create a dynamic invoicing app. First step would be to create invoices. The features it should include:

- ☐ Should show barebones of invoice creation form with invoice number, invoice entity information (name, address, extra information)
- ☐ Add lines to the invoice. Lines may include a product code, description (with optional second line of description), amount, unit, unit price & total price
- ☐ Add notes to the invoice, including possibly how to pay it, where to send checks, etc.
- ☐ Send the invoice via email (does not have to actually send emails, but if it does, great!)
- ☐ View invoices including status (paid, outstanding, late, etc.)

You can use framework of your choice or you can go pure PHP. If you would like to use a mocked-out database interface, that is fine (even static data in code is ok).

**Extra credit features**

- ☐ Add a due date to an invoice
- ☐ View late invoices, or even better, alert when an invoice is late
- ☐ Polish and UX

If you have any questions, please ask!
